

AMPHETAMINES

A central nervous system stimulant.

ABOUT AMPHETAMINES

A synthetic, addictive, mood-altering drug, used legally as a prescription drug to treat children with ADD and adults with narcolepsy.

Amphetamines: Psychostimulants. Produce increased wakefulness and focus in association with decreased fatigue and appetite.

Methamphetamine: Addictive stimulant. Activates certain systems in the brain.

Ecstasy or MDMA: Amphetamine-like and hallucinogenic properties.

ABUSE

- When abused, it is ingested orally or injected.
- "Ice" or crystallized methamphetamine hydrochloride is smoked.
- Ecstasy is ingested orally.

EFFECTS

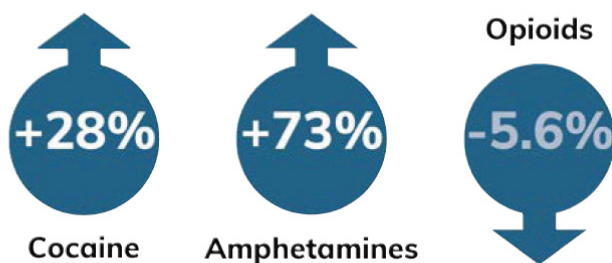

Ecstasy: A "feel good" drug, the effects may include increased confidence and energy, lowered inhibitions, feelings of wellbeing, feelings of closeness to others, and empathy. Conversely, there can also be anxiety, paranoia, and aggression. Effects can be felt within 20 minutes to an hour and last up to 6 hours.

Methamphetamine: Smoking causes an immediate rush that passes within minutes while snorting or taking orally brings effects in 5-20 minutes. 6-24 hour duration. The effects include increased attention, talkativeness, animated behavior, decreased appetite and fatigue and feelings of power and/or euphoria.

REASONS TO ADD TO YOUR DRUG PANEL

- Methamphetamines are the drug most responsible for violent crime. (NIDA)
- Like cocaine, amphetamines use is rising while opioids use levels or falls.

Psychostimulants are on the rise.
